Uncertainty-aware MR-based CT synthesis for robust proton therapy planning of skull-based tumour

PAUL SCHERRER INSTITUT

ETH zürich

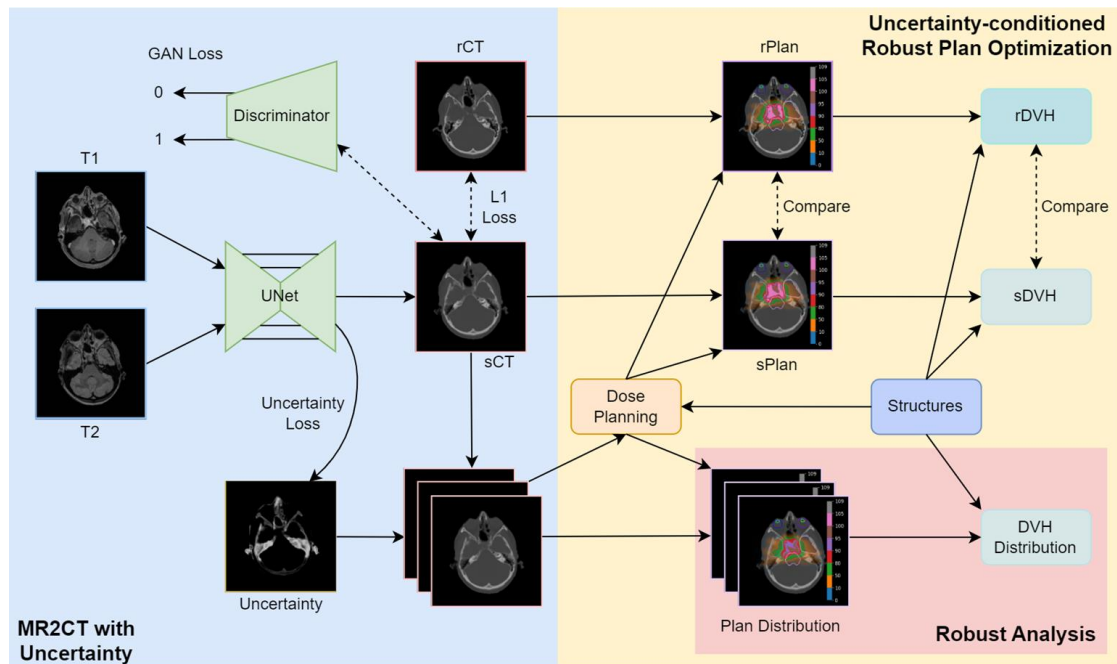

Strategic Focus Area
**Personalized Health
and Related Technologies**

InspireProject

An Uncertainty-aware Framework for Robust MR-based Proton Therapy

MR2CT with Uncertainty

- Modified conditional GAN network
- Estimates both sCT and voxel-wise uncertainty

Uncertainty-conditioned Robust Plan optimization

- Conditioned on voxel-wise uncertainty
- Account for network prediction errors

Robust Analysis

- Maximum-minimum doses
- Over- and Under-shoot cases

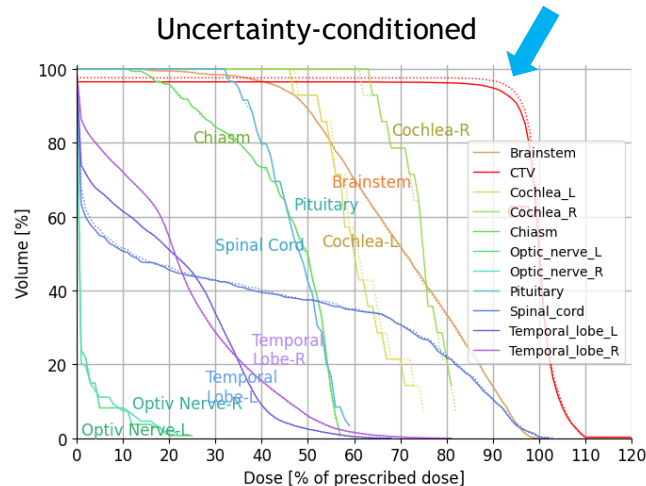

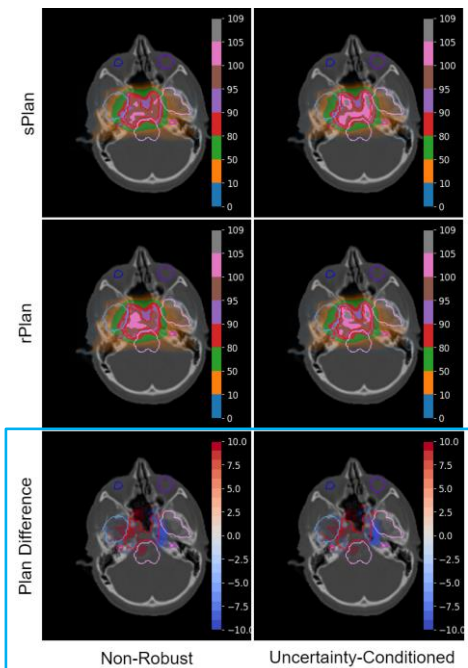

Generation of Synthetic CT with Uncertainty Map and Image-level Evaluation

MAE_body	MAE_bone	MAE_tissue	Dice_body	Dice_bone	Dice_tissue
80.84±9.84	221.88±31.69	35.78±6.07	90.33±2.43	85.53±4.16	95.13±0.80

- **Dataset**
 - 64 skull-based patients from PSI
 - 8-fold cross validation
- **Network**
 - UNet structure
 - Bayesian Neural Network
 - Per-voxel Laplacian distribution
 - Estimates the parameter $[\mu, \beta]$
- **Evaluation**
 - MAE and Dice between sCT and rCT
 - Correlation Coefficient between uncertainty and MAE: 0.62 ± 0.01
 - Positively correlated

Uncertainty-aware Robust Optimization and Dosimetric-level Evaluation

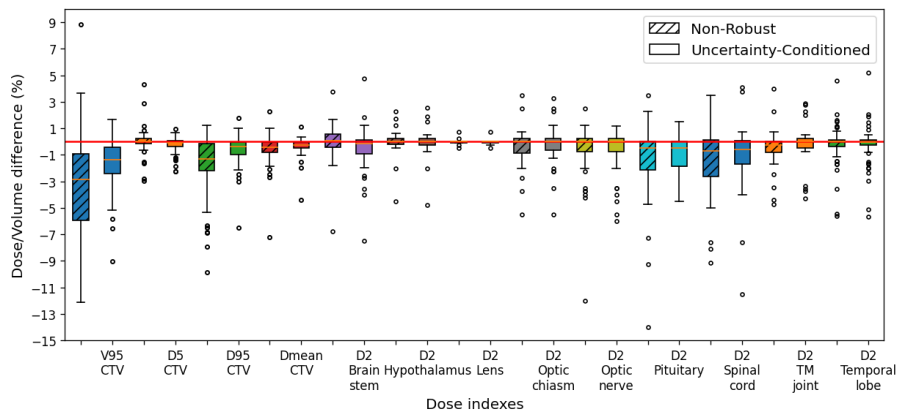

Robustly treatment planning on sCT

- Account for network prediction uncertainty
- Over the per-voxel distribution

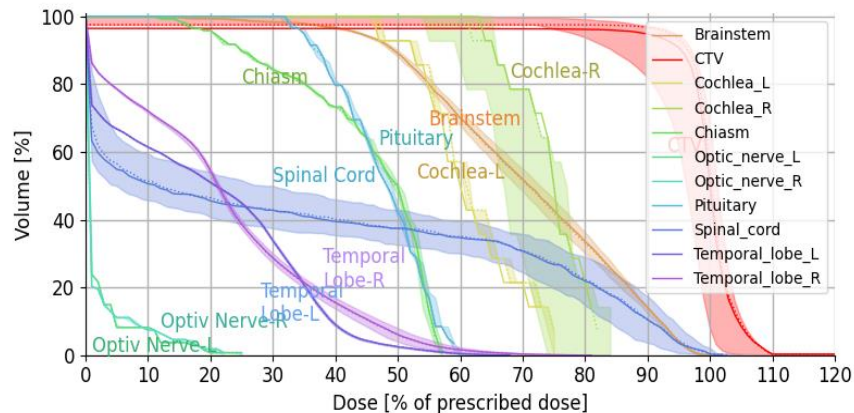

Recalculate on sCT --> sPlan
 Recalculate on rCT --> rPlan

- Less difference between sPlan and rPlan
- Closer DVH curves between sPlan and rPlan

Robust Analysis and Conclusion

Uncertainty-aware robust plan optimization achieves more conformal sPlan and rPlan

DVH distribution provides tool to analyze the robustness

- High-quality sCT generation from MR images with 3D uncertainty prediction
- Improved plan robustness against network prediction error by uncertainty-aware optimization
- Clinically acceptable accuracy (+/-3%) for proton therapy planning of skull-based tumour
- Powerful tools for determining the clinical usefulness of synthetic CTs for individual patients
